

**EVALUATION OF ANTIWOLBACHIAL
TREATMENT IN PATHOGENESIS OF
LYMPHEDEMA DEVELOPMENT**

A THESIS

PRESENTED TO THE DEPARTMENT OF CLINICAL
MICROBIOLOGY, SCHOOL OF MEDICAL SCIENCES, COLLEGE
OF HEALTH SCIENCES, KWAME NKRUMAH UNIVERSITY OF
SCIENCE AND TECHNOLOGY KUMASI, IN PARTIAL
FULLFILLMENT OF THE REQUIREMENT FOR THE AWARD OF

M'PHIL. CLINICAL MICROBIOLOGY

BY

ALEXANDER KWARTENG (BSC. HONS)

DEPARTMENT OF CLINICAL MICROBIOLOGY

MAY, 2010

DECLARATION

I hereby declare that this submission is my own work toward the award of an MPhil degree in Clinical Microbiology and that to the best of my knowledge, it contains no material previously published by another person nor material which had been accepted for the award of any other degree of the university, except where due acknowledgement had been made in the text.

DEDICATION

This thesis is dedicated to Madam Abena Badu, Ms. Sarah Kwarteng not forgetting my dear friend Ms. Evelyn Efiba Vidda.

ACKNOWLEDGEMENTS

But thanks be to God who gives us victory through our Lord Jesus Christ. Therefore, my brethren, be steadfast, immovable, always abounding in the work of the Lord, knowing that your labor is not in vain in the Lord. (1st Corinthians 15:57-58)

This thesis would not have been a success without the advice of Prof. Ohene Adjei my supervisor, Prof Adu Sarkodie, the Head of the Department of Clinical Microbiology, School of Medical Sciences, Kwame Nkrumah University of Science Technology (KNUST) and Thomas van Kampen, Director of Kumasi Centre for Collaborative Research in Tropical Medicine (KCCR). Big thanks goes to Prof. Dr. Achim Hoerauf, Dr. Sabine Mand, Dr. Sabine Specht, Dr. Susane Denninger all of the Department of Immunology, Microbiology, and Parasitology at the University of Bonn, Germany as well as Dr. Peter Konadu of the Komfo Anokye Teaching Hospital (KATH).

To Dr. Alex Yaw Debrah and Mrs. Linda Debrah of KCCR, I want to say thank you for your unquantifiable support during my period of study at KCCR/SMS on the filariasis projects. My appreciation also goes to the following supporting staff and students Mr. Yebaoh Marfo Debrekyei, Mr. Henry Hanson, Mr. Yusif Mubarak, Mr. Jubin Osei- Mensah, Mr. Kenneth Otabil-Bentum, Ms. Lilian Duku, at KCCR, project drivers especially Mr. Paul Marfo Bekyie, Mr. Seth Wiredu, Mr. Philip Frimpong, Mr. Emmanuel Laare, the cook Miss. Ruth Boateng as well as all village the health workers and the Health Authorities in the Nzema East and Ahanta West districts of the Western Region

My deepest appreciation goes to my father, the late Mr. Yaw Kwarteng and my dear mother Madam Abena Badu for their parental support and care. I also want to thank Mr. Yarhands Dissour Arthur, Mr. Alex Aboagye, Mr. Kenneth Fletcher and Miss Mercy Ayittey who played diverse role in achieving this success, I am grateful to you all.

ABSTRACT

Globally, filarial LE affects more than 16 million individuals. Registered antifilarial drugs do little to mitigate the pathology. Currently, there is no definite drug for treating subjects who develop the pathology because the Global Programme to Eliminate Lymphatic Filariasis (GPELF) relies only on hygiene management practices as the only source of relieve for this group. Antiwobachial therapy is therefore believed to be the most promising approach for treating lymphedema. To elucidate the efficacy of anti-wobachial treatment with antibiotics in lymphedema, 180 individuals were recruited from 25 endemic communities of the Nzema East and Ahanta West Districts of the Western Region of Ghana for a double blind placebo-controlled trial. In all, 119 patients were stratified according to circulating filarial antigen (CFA) status, randomized to receive 200mg/d of doxycycline (n=46), 1000mg/d of amoxicillin (n=36) and placebo (n=38) for 42days in a daily observed treatment. Although minimal significant improvements were seen for almost all parameters measured in the CFA-positive treated with doxycycline, there were remarkable improvement in the CFA-negative doxycycline-treated patients particularly in the area of decreased mossy lesions, healed sores, reduced knobs, regressed leg stage, decreased ultrasound measurements ($p=0.0001$), reduced filarial acute attacks, halt of disease progression, significant reduction in antigenaemia levels ($p=<0.00$). In the majority of the patients who received 6 weeks doxycycline treatment, there was a highly significant improvement (43.9%) in the leg stage at the end of the study. Although there was halt of disease progression (61.9%) as well as decreased filarial attacks in the amoxicillin treated group, there was no significant improvement in the amoxicillin as well as the placebo-treated patients regarding all other parameters assessed. The study suggests that doxycycline as the first therapy for treating lymphedema and recommends its use as individual drug administration.

CHAPTER ONE

1.0	BACKGROUND	1
1.1	General Overview of Lymphatic Filariasis	2

CHAPTER TWO

2.0	LITERATURE REVIEW	7
2.1	THE PARASITES AND VECTORS TRANSMISSION	7
2.1.1	Life Cycle of the Parasite	7
2.2	THE SPECTRUM OF CLINICAL MANIFESTATIONS	9
2.2.1	Filarial Attacks	9
2.2.1.1	Acute Attacks	9
2.2.1.2	Acute Filarial Lymphangitis (AFL)	10
2.2.1.3	Acute dermatolymphangoandentitis (ADLA)	10
2.2.1.4	Lymphedema and Elephantiasis	10
2.3	MECHANISM OF PATHOGENESIS IN LYMPHEDEMA	12

2.3.1	Economic and social burden of lymphedema	13
2.4	CHEMOTHERAPY	14
2.4.1	Ivermectin	14
2.4.2	Mechanism of action, pharmacokinetics, safety and efficacy of ivermectin	14
2.4.3	Diethylcarbamazine	15
2.4.4	Mechanism of action, pharmacokinetics, safety and efficacy of DEC	15
2.4.5	Albendazole	16
2.4.6	Mechanism of action, pharmacokinetics, safety and efficacy of albendazole	16
2.4.7	Lymphedema and antibiotics- tetracycline in focus	17
2.4.8	Absorption and extraction of tetracycline	17
2.4.9	Contraindications of tetracyclines	18
2.4.10	Anti-wolbachial treatment in lymphatic filariasis-lymphedema	18
2.4.11	The role of <i>Wolbachia</i> in the development of lymphedema	19
2.5	VASCULAR ENDOTHELIAL GROWTH FACTOR (VEGFS) AND LYMPHEDEMA DEVELOPMENT	21
CHAPTER THREE		
3.0	MATERIALS AND METHODS	22
3.1	Study area	22

3.2	Ethical clearance	24
3.3	Selection of villages	24
3.4	Selection of Lymphedema Patients	25
	3.4.1 Exclusion and inclusion criteria	25
3.5	Clinical chemistry test	25
3.6	Determination of circulating filarial antigens	26
3.7	Assessment of microfilaraemia in lymphedema	26
3.8	Limb measurement of lymphedema patients	27
3.9	Staging lymphedema legs	28
3.10	Ultrasound examination	30
3.11	Treatment regimen	30
3.12	Follow -up examinations of patients	30
3.13	Statistical Analysis	30

CHAPTER FOUR

4.0	RESULTS	32
4.1	Adherence to treatment, stratification and drop-out	32
4.2	Adverse effects of doxycycline, amoxicillin and placebo treatment	34
4.3	Microfilaraemia and Antigenaemia values of <i>Wuchereria bancrofti</i> from start of treatment	35
4.4	Lymphedema staging- sum of both legs	38
	4.4.1 Assessment of lymphedema staging-improvement, halt of progression, deterioration 24 months after treatment	42

4.5	Circumference-measurement of the lymphedema legs	43
	4.5.1 Effects of treatment of on mean leg circumference measurement-sum of both legs (10-30cm) comparing pretreatment versus study time points	44
4.6	Malleolus lateralis and medialis measurements	45
	4.6.1 Effects of treatment on malleolus measurement at various time points	46
	4.6.2 Efficacy of treatment on <i>Malleolus lateralis</i> sum of both legs split by CFA status at study time points	47
	4.6.3 Efficacy of treatment on <i>Malleolus medialis</i> - sum of both legs according to CFA status at study time points	49
4.7	Incidence of acute attacks during the study period	50
 CHAPTER FIVE		
5.0	DISCUSSION	52
5.1	Anti-wolbachial treatment in lymphedema	52
5.2	Microfilariae and Antigenaemia	55
	5.2.1 Effect of treatment on microfilariae and antigenaemia levels	55
5.3	Lymphedema staging	57
	5.3.1 Effect of treatment on legs staging	57
5.4	Effects of treatment on leg measurements	62
5.5	Effects of treatment on <i>Malleolus</i> split by CFA status	63
5.6	Incidence of acute attacks during study period	65
5.7	Assessment of lymphedema staging–improvement, halts of progression,	

progression at 24 months after treatment 67
